Critical values of Mann-Whitney $\mathbf{U}$ at $\mathbf{p}=0.05$ (two-tailed test):

To use this table, compare your calculated $U$ to the critical value in the table. Your $U$ has to be SMALLER than the critical U.
e.g.: suppose our obtained $U$ is 22 , with $N 1=13$ and $N 2=16$. The critical value of $U$ is 59 . Our obtained $U$ is SMALLER than 59 , and is therefore statistically significant.
The bigger the difference between your groups, the smaller the value of $U$, and hence the less likely it is to have occurred by chance.
In other words, a dfifference between two groups as large as the one that we have obtained, is likely to occur by chance with a $\mathrm{p}<.05$.

|  | $N_{1}$ | $N_{2}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
